Introduction

This document explains how to manage color output on the Fiery® C9 Server and provides information about color conversion and other color operations.

This document is part of a set that includes documentation for users and system administrators. For more information about supported operating systems and system requirements, see Configuration and Setup.

Terminology, conventions, and documentation resources

This document uses the following terminology and conventions to refer to the Fiery® C9 Server, printer, and supported operating systems.

**Key features of ColorWise**

ColorWise is the color management system (CMS) built into the C9 Server and designed to provide both casual and expert users with the best color output for a variety of purposes. The ColorWise default settings provide high-quality, out-of-box color from many applications.

ColorWise default settings allow casual users to achieve quality output without knowing about or changing any color settings on the C9 Server. ColorWise also provides controls to allow expert users to obtain the best color output.

Depending on your particular needs, you can:

- Set the behavior of CMYK printing to emulate offset press standards.
- Match PANTONE and other spot colors for the best match when printing using four-color press conditions or presses with extra, custom plates.
- Select a rendering intent for RGB printing. Rendering intents allow for rich, saturated printing of presentation graphics, smooth, accurate printing of photographs, and relative or absolute colorimetric rendering for specialized needs.
- Define the source of incoming RGB color data for better color conversion of RGB data with no source information.
- Determine whether RGB data is converted into the full gamut of the printer or is first converted into the gamut of another device, such as a press standard. This feature is useful for making one device behave like another for RGB data. It also allows you to evaluate the appearance of an RGB file under different printing conditions without having to convert the RGB file to CMYK first.

ColorWise color management (ColorWise) offers an open color architecture, allowing users to customize the C9 Server to meet new printing needs as they arise. ColorWise supports ICC profiles, which are industry-standard color profiles that describe the color behavior of a device. Note that ICC specification version 4 profiles (profile version 4.2.0.0) are supported as well as version 2. Downloading ICC profiles to the C9 Server enables the C9 Server to
simulate a custom press (or another printer), as well as accurately print colors from a particular monitor or scanner. In addition, you can create customized ICC profiles for the C9 Server.

**Color features in Command WorkStation**

Command WorkStation includes color-management tools and color-related features.

- **Color management**
  Command WorkStation allows you to set the default settings of the ColorWise print options for the C9 Server. These default settings are applied to all print jobs sent to the C9 Server, unless a user overrides them for an individual job.

- **Profiles**
  Command WorkStation allows you to manage all of the ICC profiles used in C9 Server workflows. You can also create custom profiles by editing existing CMYK source or output profiles and saving them as new profiles.

- **Calibrator**
  For consistent color, calibrate the C9 Server on a regular basis. Command WorkStation includes an easy-to-use calibrator, which allows you to calibrate using a measurement instrument.

  Command WorkStation also allows you to use any Status T densitometer by importing data in a standard file format. In this case, it is important to note that the quality of the instrument used determines the quality of the calibration.

- **Spot-On (spot colors)**
  Spot-On is a spot color (named color) manager. You can adjust and manage lists of spot colors and their CMYK equivalents. The matching lists of spot colors and CMYK values are known as spot color dictionaries. Spot-On allows you to edit spot color definitions on the C9 Server and create custom spot color definitions and dictionaries.

  Spot-On is also required for spot color overprinting, when a job contains overlapping spot-color objects.

- **Image Enhance Visual Editor (IEVE)**
  IEVE is an image-editing application that provides users with a visual workspace to adjust individual images in a job. With IEVE, you can see the effects of your adjustments and fine-tune the appearance of an image.

- **Halftone Simulation**
  The Halftone Simulation feature allows you to configure a custom halftone screen and apply it to a job. For more information, see *Fiery Graphic Arts Package, Premium Edition*.

Installing and starting Command WorkStation on a Windows or Mac OS computer is described in *Utilities*. You can install Command WorkStation from the User Software DVD or from the C9 Server over the network.
Color print options

The C9 Server provides print options that affect the output of color objects in various color spaces. By specifying the appropriate settings for each print option, you can obtain the expected results for your jobs.

Color management determines how color data in a job is converted to the color data that is sent to the printer. Some color print options affect the color management applied to a job. Other color print options are not related to color management.

Color management on the C9 Server

The color management system on the C9 Server determines how the color data in a document is converted from source to output.

Applications allow you to generate color data in different color spaces. The most common type of color data produced from office applications is RGB, while prepress applications generally produce CMYK data. Desktop applications also generate spot colors, such as PANTONE colors. A single page of a document may contain a mix of RGB, CMYK, and spot colors.

Through print options that apply specifically to RGB, CMYK, or spot color data, you specify the color management of a job.

Note: Before you set these color management options, you must set the Color Mode option, which specifies the output color space (CMYK, for example). If you change the Color Mode setting, color management options are reset to the server default settings.

RGB Source applies strictly to RGB color data. The other options that affect RGB color also affect Lab, XYZ, and other calibrated color spaces, which are more rarely used.

If a job contains calibrated CMYK (CIEBasedDEFG) data, the CMYK processing options are not used. Instead, the RGB/Lab Rendering Intent print option, which normally affects only RGB data, is used to process the calibrated CMYK data.

**Auto trapping**

Trapping is a technique where the size of objects is modified so that colors printed next to each other overlap slightly, to prevent white spaces between two colors. These white spaces, or "halos," can be caused by factors such as misregistration, the physical properties of the ink or toner, and the stiffness of the media.

If you turn on the Auto trapping option, trapping is applied to all of the objects in a job.

The C9 Server has default trapping values that are optimized for a Fiery-driven print device using regular paper. If the default trapping values do not provide the results necessary for the media that you use, you can modify the values to meet your requirements in Command WorkStation with the configurable auto trapping feature.

Configurable auto trapping is part of Fiery Graphic Arts Package, Premium Edition. For more information about configurable auto trapping, see *Fiery Graphic Arts Package, Premium Edition*. 
Black overprint

The Black overprint option specifies whether black text, or black text and vector graphics (where black is defined as RGB=0, 0, 0, or as CMYK=0%, 0%, 0%, 100%) print over colored backgrounds. If you turn off this option, black text, or black text and graphics knock out colored backgrounds. Knocking out can create a white edge around objects, or a "halo," caused by the misalignment of color plates.

Note: You can set Black overprint only if Black text and graphics is set to Pure Black On.

The Black overprint option has the following settings:

- Text - Black text overprints colored backgrounds, eliminating white gaps and reducing the halo effect from misregistration of colors.
- Text/Graphics - Black text and graphics overprint colored backgrounds, eliminating white gaps and the halo effect from misregistration of colors.
- Off - Black text and graphics knock out colored backgrounds.

Note: PostScript applications may perform their own black overprint conversions before printing.

An example of how you might use this setting is a page that contains black text on a light blue background. The background blue is CMYK=40%, 30%, 0%, 0%. The black text is CMYK=0%, 0%, 0%, 100%.

- With Black overprint set to Text or Text/Graphics, the final text or graphic portions of the page are overprinted, or combined with the underlying color. Black colors generated by applications (for example, RGB=0, 0, 0 or CMYK=0%, 0%, 0%, 100%) are printed using black only. This means that black text and line art do not exhibit halftone artifacts (as long as the printer is calibrated correctly). No transition in cyan and magenta occurs and the quality of the output is improved, because it does not show artifacts near the edges of text.
- With Black overprint set to Off, the border of the text or graphic is on an edge that has cyan and magenta on one side (outside the object) and black on the other side (inside the object). This transition may cause visible artifacts due to the practical limitations of the printer.

Note: The reproduction of CMYK components is affected by the CMYK/Grayscale Source setting and calibration when CMYK is not 0%, 0%, 0%, 100%.

Black Point Compensation

The Black Point Compensation option lets you control the output quality of shadow areas for CMYK source colors.

Use Black Point Compensation to enhance details in shadows when the CMYK source space is larger than the gamut of the printer. In proofing applications, when the CMYK source space is smaller than the gamut of the printer, do not use this option.

Note: For RGB source colors, black point compensation is always applied.

Black point compensation works by scaling the source colors so that the darkest point in the source profile maps to the darkest point in the output profile.

Black Text and Graphics

The Black Text and Graphics option affects black text and vector graphics. When you set this option to Pure Black On, the black generated by applications (RGB=0, 0, 0 or CMYK=0%, 0%, 0%, 100%) is printed using black only.

With Black Text and Graphics set to Pure Black On, black text and line art are not misregistered, since only one colorant is used. This setting also eliminates blasting, which is an undesirable effect that occurs when excess
amounts of toner, combined with certain types of paper stock, cause objects to spread beyond their defined boundaries.

For some jobs, we recommend setting Black Text and Graphics to Normal. For example, if a job includes gradient fills that use black, the Normal setting gives the best result.

If you set Black Overprint to Text or Text/Graphics, Black Text and Graphics must be set to Pure Black On.

**Note:** Use Black Text and Graphics only when printing composites, not separations.

The following table describes the behavior of Black Text and Graphics with black defined in different color spaces.

<table>
<thead>
<tr>
<th>Color</th>
<th>Black Text and Graphics = Normal</th>
<th>Black Text and Graphics = Pure Black On or Rich Black On</th>
</tr>
</thead>
<tbody>
<tr>
<td>RGB=0,0,0 (all other RGB values are unaffected by Black Text and Graphics)</td>
<td>Printed according to the definition for RGB=0,0,0 in the output profile. This may be a rich black (one that uses multiple colorants) if the output profile specifies a rich black, or K-only if the output profile specifies K-only for RGB=0,0,0. The output is affected by calibration.</td>
<td>Printed as 100% K (Pure Black On) or 100% K plus 50% Cyan (Rich Black On) using black and cyan.</td>
</tr>
<tr>
<td>CMYK=0%,0%,0%,100% (all other CMYK values are unaffected by Black Text and Graphics)</td>
<td>Printed as K-only or as a rich black using all colorants, depending on the CMYK/Grayscale Source and CMYK/Grayscale Processing Method settings. If CMYK/Grayscale Processing Method is set to Pure Primaries, or if CMYK/Grayscale Source is set to Bypass Conversion, CMYK=0%,0%,0%,100% prints as 100% K and the amount of black is limited by the CMYK/Grayscale Source profile and calibration. If CMYK/Grayscale Processing Method is set to Full (Output GCR), CMYK=0%,0%,0%, 100% is printed as a rich black using all colorants according to the output profile. The output is affected by calibration. If CMYK/Grayscale Processing Method is set to Full (Source GCR), CMYK=0%,0%,0%, 100% is printed as a rich black using all colorants according to the CMYK/Grayscale Source profile. The output is affected by calibration. <strong>Note:</strong> Setting CMYK/Grayscale Source to ColorWise Off disables the CMYK Source profile and calibration. In this case, the black is not limited by calibration.</td>
<td>Printed as 100% K (Pure Black On) or 100% K plus 50% Cyan (Rich Black On) using black and cyan, regardless of the CMYK Source and CMYK Processing Method settings.</td>
</tr>
<tr>
<td>Color</td>
<td>Black Text and Graphics = Normal</td>
<td>Black Text and Graphics = Pure Black On or Rich Black On</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>----------------------------------</td>
<td>----------------------------------------------------------</td>
</tr>
<tr>
<td>Spot colors (unaffected by Black Text and Graphics)</td>
<td>Standard spot color processing</td>
<td>Standard spot color processing</td>
</tr>
</tbody>
</table>

**Note:** PostScript applications may convert elements defined as RGB=0, 0, 0 to four-color CMYK black before sending the job to the C9 Server. These elements are not affected by the Black Text and Graphics option.

### CMYK/Grayscale Processing Method

The CMYK Processing Method option allows you to define the CMYK-to-CMYK conversion method for the CMYK data in a print job.

- **Pure Primaries** - If your C9 Server supports this setting, it outputs the primary colors in a job (C only, M only, or Y only) as primary colors, using only a single colorant. The result is pure-looking primary colors, with minimal banding in gradients.

  Pure Primaries compromises overall color accuracy. Do not use Pure Primaries if color accuracy is important.

- **Full (Source GCR)** - Uses the black generation specified by the CMYK Source profile. Colorimetric accuracy is reduced. This method can be used to preserve pure black without converting it to CMYK. However, the Gray (CMYK) option is more typically used to preserve pure black. The black generation level that was specified in the original (source) document is approximated.

- **Full (Output GCR)** - The recommended method when color accuracy is required. This method provides a complete and accurate simulation based on colorimetric transformations. With this method, all CMYK data is reproduced using the black generation specified by the output profile.

**Note:** When you specify Pure Black On for Black Text and Graphics, and Full (Output GCR) or Full (Source GCR) for CMYK Processing Method, the black text and graphics in your document are printed with 100% black.

### CMYK/Grayscale Source and RGB/Lab Source

The CMYK/Grayscale Source and RGB Source print options allow you to define the color spaces of the CMYK and RGB data, respectively, in your document so that the appropriate color conversion occurs on the C9 Server.

Commonly used color spaces are available on the C9 Server. For others, you can import custom profiles to the C9 Server.

#### CMYK/Grayscale Source

To properly manage color in a printed image that was separated using an ICC profile, the same profile must be specified for printing the image.
The CMYK/Grayscale Source profile setting you specify depends on the CMYK profile or press standard for which the CMYK data was separated. This option affects CMYK data only.

- For images that were separated using a custom separation (such as a separation produced with an ICC profile), select the profile used for RGB to CMYK conversions in the prepress workflow on the C9 Server with the CMYK/Grayscale Source setting.
- For images that were separated for a press standard, select the press standard as the CMYK/Grayscale Source setting.

If the job contains an embedded CMYK profile, select the Use Embedded Profile When Present (CMYK) option. The embedded profile is applied to CMYK data.

The CMYK/Grayscale Source option can be set to any CMYK source profile that is present on the C9 Server.

If you do not want CMYK data in a job to be converted to the output color space, you can select one of the following settings:

- Bypass Conversion - This setting sends the original CMYK data in the job to the printer without conversion, but with calibration applied.
- ColorWise Off - This setting sends the original CMYK data in the job to the printer without calibration applied and without converting the CMYK data. The CMYK data is still subject to the total toner limit, however.

The ColorWise Off setting is available for a specific job but it cannot be the default setting on the C9 Server. You select this setting for a specific job.

**Note:** When you print with the ColorWise Off setting, make sure that the options you choose in your application do not cause the application to modify CMYK data. You must specify no color management in the application when you print with the ColorWise Off setting.

### RGB/Lab Source

When you specify a profile for RGB Source, the C9 Server overrides source color space definitions or profiles that other color management systems may have specified. For example, if your document contains an embedded RGB profile, the RGB Source setting overrides it.

When you specify an RGB source profile, the output from the C9 Server is consistent across platforms. The RGB Source options are as follows:

- EFIRGB - Specifies an EFI-defined color space recommended for users who have no detailed information about their RGB data.
- sRGB (PC) - A Microsoft and Hewlett-Packard recommended color space designed for typical home and office applications.
- Apple Standard - Specifies the color space of an older Mac OS computer monitor.
- Adobe RGB (1998) - An Adobe-defined color space, used in some prepress workflows as the default working space for Adobe Photoshop.
- eciRGB v2 - The European Color Initiative (ECI) recommended space for use as an RGB working color space and color data exchange format for ad agencies, publishers, reproduction, and printing houses.
- Fiery RGB v5 - An EFI-defined color space recommended for users of office applications. This color space is similar to EFIRGB but is larger and can provide a more desirable blue output.

In cases where you do not want RGB Source to override another specified source color space, select the Use Embedded Profile When Present (RGB) option.
If the Use Embedded Profile When Present (RGB) option is enabled, the C9 Server ignores RGB Source and uses the RGB profile embedded in the print job (if any) as the RGB source profile.

**CMYK/Grayscale Device Link and RGB/Lab Device Link**

The CMYK/Grayscale Device Link option or the RGB/Lab Device Link option, along with the Output Profile option, allows you to select a CMYK-to-CMYK device link profile or an RGB-to-CMYK device link profile (respectively).

To be selected for a print job, a device link profile must reside on the C9 Server and be associated with a specific source profile (CMYK/Grayscale Device Link for a CMYK-to-CMYK device link profile or RGB/Lab Device Link for an RGB-to-CMYK device link profile) and output profile (the Output Profile setting).

When you select the source profile and output profile settings associated with a device link profile, the C9 Server bypasses its normal color management and applies the device link conversion to the color data in the job. The source profile and the output profile are not used.

Profiles that do not reside on the C9 Server do not appear as settings. A device link profile that is not associated with a source profile setting and an output profile setting cannot be selected for a job. Therefore, even though the source profile and output profile that are associated with a device link profile are not used to calculate color conversions, they must reside on the C9 Server.

**Combine separations**

The Combine separations option specifies how to print separated CMYK data.

You can combine Cyan, Magenta, Yellow, and Black separations.

You can also combine one or more spot colors.

- **Off** - Prints each separation individually.
- **On** - Combines separations as a single, composite-color document, and automatically sets the following print options: Color mode (CMYK) and Black overprint (Off).

The results of combining the multiple plates are predictable and accurate, regardless of the original application used. This feature also fully supports DCS 2.0 file formats when included in a PostScript print job from a page-layout application.

The following applications have been tested with Mac OS and Windows for compatibility with the Combine separations option:

- Adobe Illustrator
- Adobe InDesign
- Adobe PageMaker
- QuarkXPress

**Note:** You cannot use Combine separations at the same time that you use the following features: Substitute colors, Composite overprint, Postflight, or Black overprint.
**Composite overprint**

The Composite overprint print option allows you to print overprinted objects as specified in the source file.

When overlapping objects are printed, the foreground object can either overprint or knock out the background object. With overprinting, the color of the background object shows through the foreground object where they overlap, and the resulting color is a combination of the colors of the two objects. With a knockout, the foreground object hides the background object where they overlap.

- **Off** - An overprinted object knocks out a background object.
- **On** - The area of overlap between two overprinted objects is a blend of the two colors.

**Note:** The Composite overprint option does not overprint the foreground object if it is an RGB object.

The Composite overprint print option is supported for PostScript and PDF jobs produced by the following applications:

- Adobe Acrobat
- Adobe Illustrator
- Adobe InDesign
- QuarkXPress
- CorelDRAW

The 2-color print mapping option is ignored when Composite overprint is turned on.

You cannot use Composite overprint at the same time that you use Combine separations.

**Gray and Black (CMYK and RGB)**

When the Gray (RGB) option is turned on, any RGB color that has equal R, G, and B values is printed as K-only black instead of CMYK black. Similarly, when Gray (CMYK) is turned on, any CMYK color where C, M, and Y are 0 (zero), and K is any value is printed as K-only black instead of CMYK black.

You can turn on Gray (RGB) or Gray (CMYK) for either Text and Graphics or Text, Graphics, and Images. "Graphics" refers to vector graphics. "Images" refers to bitmap images.

The following limitations apply:

- The Gray (RGB) and Gray (CMYK) options have no effect on a job that is sent as separations.
- If CMYK Processing Method is set to Pure Primaries, Gray (CMYK) does not affect the output.
- If Separate RGB/Lab to CMYK Source is turned on, Gray (RGB) is turned off. Likewise, if Gray (RGB) is turned on, you cannot turn on Separate RGB/Lab to CMYK Source.
- If Black Text and Graphics is set to Pure Black On or Rich Black On, it takes precedence over Gray (RGB) and Gray (CMYK) for 100% black text and graphics.
- If a gray is specified as a spot color, Gray (RGB) and Gray (CMYK) do not affect that gray.
**ImageViewer curves**

The **ImageViewer curves** print option lets you apply color curve edits from **ImageViewer** that have been saved on the server as a preset.

**ImageViewer** in Command WorkStation can be used to edit the CMYK curves of a job on the C9 Server. These curve edits can be saved as a preset and applied to other jobs. Use the **ImageViewer curves** option to select a preset for your job.

Factory-supplied curve edits apply some typical color corrections:

- No correction
- Lighter highlights
- Midtone boost
- Shadow detail
- Reduce C (cyan) cast
- Reduce M (magenta) cast
- Reduce Y (yellow) cast

After the job is processed, the edits become part of the job and are no longer visible as edits when you view the job in **ImageViewer**.

**Optimize RGB transparency**

The **Optimize RGB transparency** option corrects color errors that can occur in jobs that contain transparent RGB or Lab objects.

Optimize RGB transparency affects jobs with the following characteristics:

- The job is in PDF format (submitted to the C9 Server as a PDF file, not submitted by printing from an application).
- The job contains transparent RGB or Lab objects. They might be objects that you specified as transparent using an application that supports this capability, or they might be objects with a special effect, such as a drop shadow, that uses transparency to achieve the effect.
- The transparent objects overlap, creating an area of mixed color.

If you turn on **Optimize RGB transparency**, the C9 Server uses the correct RGB source profile and rendering intent when converting the overlapping RGB colors to CMYK during the PDF-to-PostScript conversion. If you turn off **Optimize RGB transparency**, the area of overlapping colors might print with incorrect color or undesirable artifacts.

When **Adobe PDF Print Engine Preferred** is turned on, the C9 Server does not convert the PDF job to PostScript when processing the job. In this case, the effect of **Optimize RGB transparency** is to recognize blending color spaces in the job, which can improve output for some blend modes when RGB blending color spaces are used.

**Optimize RGB transparency** can result in a longer processing time, especially for variable data printing (VDP) jobs that contain multiple individual PDF pages. We recommend that you turn on **Optimize RGB transparency** only when necessary to achieve correct color output.

You can specify **Optimize RGB transparency** for a job in **Job Properties** in Command WorkStation, Hot Folders, or a virtual printer.
When you print from the printer driver, the Optimize RGB transparency option does not appear because jobs printed from the printer driver are always submitted to the C9 Server as PostScript jobs, which are not affected by Optimize RGB transparency.

**Output profile**

The Output profile print option specifies the output profile used to process a job. Color data in a print job is converted to the color space of the printer, which is described by the output profile.

In addition, the calibration that is associated with the output profile is applied to the job before printing.

The C9 Server includes one or more default output profiles, each created for a specific media type. You can also import your own output profiles to the C9 Server.

The Use media defined profile setting automatically selects the output profile associated with the media type used in a print job rather than a specific output profile. If a job uses media from Paper Catalog, the output profile specified for the media in Paper Catalog is used.

CMYK/Grayscale Device Link or RGB Device Link - When you select a specific output profile in combination with one of these options, the combination specifies a CMYK-to-CMYK or RGB-to-CMYK device link profile.

The CMYK/Grayscale Device Link or RGB Device Link profile setting and the Output profile setting are used in combination to activate a device link profile. The device link profile must already be associated with specific settings for Output profile and CMYK/Grayscale Device Link or RGB Device Link. In this case, the selected output profile is not used for color management, since the device link profile is used.

**Paper Simulation**

The Paper Simulation option renders the paper white in the source document as a visible color in the printed output rather than leaving the white areas unprinted.

If the default white point values do not provide the results that you require, you can customize the paper simulation by editing the white point values with Command WorkStation, using the Paper Simulation white point editing feature.

Paper Simulation white point editing is part of Fiery Graphic Arts Package, Premium Edition. For more information about Paper Simulation white point editing, see *Fiery Graphic Arts Package, Premium Edition*.

You can print a job with Paper Simulation without customizing the white point. Many jobs may print satisfactorily with the default white point setting.

The Paper Simulation option has the following settings:

- Selected - Performs Absolute Colorimetric rendering. The paper white is rendered as a visible color.
- Not selected (default) - Performs Relative Colorimetric rendering. The paper white is not printed.

**PDF/X output intent**

The PDF/X output intent option, when turned on for a PDF/X job, specifies the use of the PDF/X output intent embedded in the PDF/X document. Typically, whether you use this option depends on whether you are printing a proof or the final output (production printing).

PDF/X is a subset of the PDF specification. PDF files can contain a variety of elements (text, graphics, even animations) and it is not always obvious how these elements should be displayed or printed. PDF/X was designed with a focus on high-quality printing. It excludes the use of PDF features that are not appropriate for graphic arts
and adds features that prevent ambiguities related to printing. A PDF/X compliant document contains embedded information about the intended printing conditions for the document.

Prints for proofing are expected to look exactly like the output of the final production device, regardless of the capabilities of the printer. For instance, when proofing Newsprint, you want the color gamut of the printer to be very limited compared to its capabilities. In production, you usually want to maximize the use of the printer gamut by applying specific color features. Even in production, however, you might choose to limit the color gamut in order to achieve consistency in the color produced by different devices.

The PDF/X output intent option only affects PDF/X files (conforming to the PDF/X3 or PDF/X-1a standard). It has no effect on non-PDF files or PDF files that are not PDF/X compliant. Profiles specified by PDF/X files must be embedded in the files, not referenced from an external locations.

**Note:** With Fiery Graphic Arts Package, Premium Edition, you can use a Hot Folders filter to determine if a PDF file is PDF/X compliant. For information about this Hot Folders filter, see *Hot Folders Help.*

When PDF/X output intent is turned on and no other setting conflicts, the C9 Server processes a PDF/X compliant file in a way that produces results defined by the intents and source color spaces embedded in the file. The C9 Server ignores the CMYK/Grayscale Processing Method and CMYK/Grayscale Source options. The rendering intents in the PDF/X file are used and the printed output is limited to the color gamut specified by the output profile embedded in the file.

When PDF/X output intent is turned off, the PDF/X output intent is ignored.

You can specify the PDF/X output intent print option for a job in Job Properties in Command WorkStation, Hot Folders, or a virtual printer.

When you print from the printer driver, the PDF/X output intent option does not appear because jobs printed from the printer driver are always submitted as PostScript jobs.

When you turn on PDF/X output intent, you must set select the Use embedded profile when present (RGB) option so that the rendering intent embedded in the PDF/X file is used. The PDF/X output intent and Use embedded profile when present (RGB) options are accessible from Expert Settings in the Color tab of Job Properties.

### RGB/Lab Rendering Intent

The RGB/Lab Rendering Intent option specifies a rendering intent for RGB/Lab-to-CMYK color conversion. This conversion can be optimized for the type of color image being printed.

To control the appearance of images, such as prints from office applications or RGB photographs from Adobe Photoshop, select the appropriate rendering intent. The C9 Server allows you to select from the four rendering intents currently found in industry-standard ICC profiles.

**Note:** If you experience tone reproduction problems, use the Photographic setting.

<table>
<thead>

### Separate RGB/Lab to CMYK Source

The Separate RGB/Lab to CMYK Source option determines how RGB colors (as well as Lab and XYZ colors) are converted to CMYK. This option defines the color spaces that are used by the C9 Server to separate the RGB data into CMYK values.

- **When Separate RGB/Lab to CMYK Source is turned on**, all RGB colors are first converted to the CMYK color space defined by the CMYK/Grayscale Source print option before being converted to the CMYK color space of the printer (as defined by the Output Profile print option). The result is a simulation of the RGB colors that would be output from a printer with the characteristics defined by the CMYK/Grayscale Source profile.

  With Separate RGB/Lab to CMYK Source, for example, if a high-quality ICC profile is available for another printer, your printer can simulate the behavior of that other printer.

- **When Separate RGB/Lab to CMYK Source is turned off**, all RGB colors are converted directly to the CMYK color space of the printer (as defined by the Output Profile print option).
Spot color matching

The Spot color matching option provides automatic matching of spot colors with their best CMYK equivalents.

- **On** - The C9 Server uses a built-in table to generate the closest CMYK matches of spot colors your printer can produce. (New tables are generated when you add new output profiles.)

  With Spot-On, the C9 Server uses the CMYK matches determined through Spot-On.

- **Off** - The C9 Server processes spot colors as CMYK data and uses CMYK equivalents defined by the spot color manufacturer, such as PANTONE. These are the same CMYK equivalents used by applications that include spot color libraries.

**Note:** Spot colors that are not included in the built-in table are treated as CMYK.

For jobs that include spot colors, turn Spot color matching on unless you are printing press simulations. In that case, turn Spot color matching off and select the appropriate CMYK/Grayscale Source.

For a PDF job that includes spot colors that are not included in the built-in table, turning Spot color matching on retains the original spot colors. The C9 Server references the built-in table to generate the closest CMYK matches of the original spot color.

**Note:** Use Spot color matching only when printing composites, not when printing separations.

Substitute colors

Substitute colors are colors that, when called for in a document by their RGB or CMYK values, are substituted with a different color that is defined in the Spot-On color dictionary. This permits exact color control and overrides individual RGB and CMYK colors.

Spot-On allows you to create a list of substitute colors. To enable substitute colors for a job, turn on the Substitute colors option.

**Note:** You cannot use Substitute colors at the same time that you use Postflight.

When you use Substitute colors at the same time that you use Spot color matching, be sure that the CMYK color that you want to replace with a substitute color is not a CMYK color that is also defined as a spot color. Otherwise, the spot color may be replaced with the substitute color, which may not be the result that you expect.

For more information about creating and using substitute colors, see Command WorkStation Help.

Use Embedded Profile When Present (CMYK and RGB)

You can specify whether the C9 Server uses the source profile (either CMYK or RGB) that is embedded in the print job rather than the source profile specified in the print settings.

**CMYK**

If you turn on Use Embedded Profile When Present (CMYK), the C9 Server ignores the CMYK/Grayscale Source option and uses the CMYK profile embedded in the print job (if any) as the CMYK source profile. If you turn off this option, the C9 Server uses the profile specified in the CMYK/Grayscale Source option.

When a CMYK profile is embedded in a job and Use Embedded Profiles When Present (CMYK) is enabled for the job, or when a job is sent with PostScript Color Management, the job contains calibrated CMYK (or CIEBasedDEFG) data. For jobs containing calibrated CMYK, the CMYK processing options are not used. Instead, the RGB/Lab Rendering Intent option, which normally affects only RGB or Lab data, is used to process the calibrated CMYK data. The RGB Source setting does not affect calibrated CMYK data.
RGB
If you turn on Use Embedded Profile When Present (RGB), the C9 Server ignores the RGB Source option and uses the RGB profile embedded in the print job (if any) as the RGB source profile. If you turn off this option, the C9 Server uses the profile specified in the RGB Source option.

Where to specify color print options

You can set color print options for all jobs by setting the default values on the C9 Server. You can set the color print options for a specific job to different values if the default values are not what you want for the job.

You specify default values for color print options in Color Setup in Command WorkStation. You can also set default values from C9 Server Setup, as described in Configuration and Setup. The defaults apply to all subsequent print jobs unless you override them.

Note: A job uses the C9 Server default settings (unless otherwise specified) at the time it is processed for printing, and not at the time it is sent to the C9 Server Hold queue.

How you set specific color print options for a particular job depends on how you submit the job to the C9 Server.

- When you print a job from an application through the printer driver, specify color print options using the settings that appear in the printer driver.
  The printer driver sends a PostScript file to the C9 Server that incorporates the settings for the color print options you selected.
- When you print a job through Hot Folders or a virtual printer, specify color print options in the Job Properties settings. These settings override the default settings on the C9 Server.
- When a job is in the Hold queue of the C9 Server, specify color print options through the Job Properties settings in Command WorkStation. These settings override the default settings on the C9 Server.

The table shows the location of each print option.

### Print from an application

To print from an application, you use the printer driver for your operating system (Windows or Mac OS).

- For information about how to install the printer driver, set up the C9 Server for printing, and set print options with the printer driver, see *Printing*.
- When you print a job from a Mac OS application using the printer driver, you must also set color-management print options appropriately.
Print with color settings in Mac OS

When you print a job from a Mac OS application using the printer driver, you must set color-management print options appropriately.

1. Select Print in your application.

2. Expand the dialog box, if necessary, by clicking the arrow next to the Printer name.

3. Click Preview, select Color Matching from the drop-down list, and then click In Printer.

4. Set other print options as needed, and then click Print to send your job.

For information about how to set print options with the printer driver for Mac OS, see Printing.
Color profiles

The C9 Server includes by default a number of RGB and CMYK profiles that you can use for printing through the RGB Source, CMYK/Grayscale Source, and Output Profile settings for a job.

You can manage the profiles on the C9 Server with Profile Manager in Command WorkStation, which allows you to import ICC profiles to the C9 Server, export profiles, delete profiles (except for default profiles), and set the properties of profiles. You can also create custom CMYK source or output profiles by editing an existing profile and saving it as a new profile.

You can install (copy) additional ICC profiles from the User Software DVD to your computer. Use the ICC profiles with applications that support ICC standards, such as Adobe Photoshop.

You can also install ICC profiles from the C9 Server to your computer over the network.

ICC profiles on the User Software DVD

The User Software DVD contains additional ICC profiles that you can install (copy) to your computer.

Adobe ICC Profiles folder

The Adobe ICC Profiles folder is located inside the Windows Color Files\Legacy\ICC Profiles folder or Mac Color Files/Legacy/ICC Profiles folder.

The profiles in this folder were created by Adobe Systems, Inc. For more information, see the documents included in the folder.

CMYK Profiles:

- CoatedFOGRA27.icc
- CoatedFOGRA39.icc
- CoatedGRACoL2006.icc
- JapanColor2001Coated.icc
- JapanColor2001Uncoated.icc
- JapanColor2002Newspaper.icc
- JapanColor2003WebCoated.icc
- JapanWebCoated.icc
- UncoatedFOGRA29.icc
- USWebCoatedSWOP.icc
- USWebUncoated.icc
- WebCoatedFOGRA28.icc
• WebCoatedSWOP2006Grade3.icc
• WebCoatedSWOP2006Grade5.icc

RGB Profiles:
• AdobeRGB1998.icc
• AppleRGB.icc
• ColorMatchRGB.icc
• PAL_SECAM.icc
• SMPTE-C.icc
• VideoHD.icc
• VideoNTSC.icc
• VideoPAL.icc

**ECI folder**
The ECI folder is located inside the Windows Color Files\Legacy\ICC Profiles folder or Mac Color Files/Legacy/ICC Profiles folder.

The profiles were created by the European Color Initiative (ECI). For more information, see the documents included in the CMYK Profiles and RGB Profiles folders, as well as the ECI web site at www.eci.org.

CMYK Profiles:
• ISOcoated_v2_300_eci.icc
• ISOcoated_v2_eci.icc
• ISOuncoatedyellowish.icc
• PSO_Coated_300_NPscreen_ISO12647_eci.icc
• PSO_Coated_NPscreen_ISO12647_eci.icc
• PSO_LWC_Improved_eci.icc
• PSO_LWC_Standard_eci.icc
• PSO_MFC_Paper_eci.icc
• PSO_SNP_Paper_eci.icc
• PSO_Uncoated_ISO12647_eci.icc
• PSO_Uncoated_NPscreen_ISO12647_eci.icc
• SC_paper_eci.icc

**EFI Support folder**
The EFI Support folder is located inside the Windows Color Files\Legacy\ICC Profiles folder or Mac Color Files/Legacy/ICC Profiles folder.

These profiles were created by EFI. For more information, see the General Requirements for Applications in Commercial Offset Lithography (GRACoL) website at www.gracol.org, the Fogra website at www.fogra.org, and the Specifications Web Offset Publications (SWOP) website at www.swop.org.
CMYK Profiles:
- EFIEURO.icc
- EFISWOP.icc
- Enterprise CMYK.icc
- GRACoL2006_Coated1_EFI.icc
- ISOCoated.icc
- ISOCoated_FOGRA39L_EFI.icc
- ISOUncoated_FOGRA29L_EFI.icc
- SWOP2006_Coated3_EFI.icc
- SWOP2006_Coated5_EFI.icc

RGB Profiles:
- EFI Fiery RGB Chroma.icc
- EFI Fiery RGB Chroma+.icc
- EFI Fiery RGB Chroma++.icc

Note: The EFI Fiery RGB Chroma profiles are designed to provide saturated colors, especially in nighttime images, while maintaining photographic detail. Of the three profiles, EFI Fiery RGB Chroma.icc has the least effect and EFI Fiery RGB Chroma++.icc has the greatest effect.
- EFIRGB.ICC
- Fiery RGB v2.icc
- Fiery RGB v4.icc
- Fiery RGB v5.icc
- RGB D65 (Splash).icc

Japan Profiles:
- EFIDIC.ICC
- EFIJMPA2.icc
- EFIJMPA3.icc
- JapanColor2011Coated.icc
- JC2001_type1_EFI.icc
- JC2001_type2_EFI.icc
- JC2001_type3_EFI.icc
- JC2001_type4_EFI.icc
- TOYO Offset Coated 2.0.icc
Add ICC profiles from the User Software DVD

The User Software DVD includes a number of ICC profiles that you can add to the C9 Server:

For most ICC-aware applications, you must install the files in the Color folder (Windows) or the Library/ColorSync/Profiles folder (Mac OS). For use with the C9 Server, you can copy the files to a folder of your choice.

**Note:** On Mac OS, see the ColorSync documentation for setting ColorSync profiles, such as EFIRGB.

1. Install the profiles on your computer.
2. Use Command WorkStation to import the files to the C9 Server.

### Install ICC profiles on a Windows computer

1. Insert the User Software DVD into the DVD drive.
2. Open the folder containing the profile.
3. Right-click the profile that you want and click Install Profile.

The profiles are installed automatically to the Windows\System32\spool\drivers\color folder on your computer.

### Install ICC profiles on a Mac OS computer

You must log on with Administrator privileges.

1. Insert the User Software DVD into the DVD drive.
2. Open the folder containing the profile.
3. Copy the profiles into Library/ColorSync/Profiles.

### Install ICC profiles on a Windows computer over the network

1. Browse to the C9 Server over the network, using the IP address or DNS server name.
2. Type the user name and password, if required.
   Ask your administrator if this information is required.
3. Double-click the PC_User_SW directory.
4. Open the ICC folder.
5. Right-click the profile that you want and click Install Profile.

The profiles are installed automatically to the Windows\System32\spool\drivers\color folder on your Windows computer.
Install ColorSync profiles on a Mac OS computer over the network

You must log on with Administrator privileges.

1. Select Go > Connect to Server.
2. Type smb:// followed by the IP address of the C9 Server and click Connect.
   If you cannot locate your C9 Server, contact your administrator.
3. Type the user name and password, if required.
   Ask your administrator if this information is required.
4. Double-click the Mac_User_SW directory.
5. Open the ColorSync folder.
6. Copy the profiles into Library/ColorSync/Profiles.

Color Bars folder

The Color Bars folder is located inside the Windows Color Files folder or Mac Color Files folder. These files are used for the Control Bar feature.

The Control Bar feature is available with Fiery Graphic Arts Package, Premium Edition. For more information, see Fiery Graphic Arts Package.

You can copy these additional color files from the User Software DVD to your computer.

You can also copy these files from the C9 Server to your computer over the network.

- FieryColorBar.eps
- Ugra Fogra-MediaWedge V2.2x_EFlv1.eps
- Ugra Fogra-MediaWedge V3.0a_EFlv1.eps
Calibration

Calibrating the C9 Server ensures consistent and reliable color output. Calibration adjusts the ink or toner densities of a job to compensate for the difference between the expected (target) densities of the printer and the actual (measured) densities that the printer outputs.

Periodic calibration is necessary to monitor the actual output of the printer. To calibrate the C9 Server, you measure the densities of printed color patches on a page.

Calibration is applied to all jobs, but you can disable it for a specific job. The ColorWise Off setting for the CMYK/Grayscale Source option disables calibration (and color management) for CMYK data in a job. You might want to disable calibration for testing purposes, for example.

If you defined a custom halftone screen with the Halftone Simulation feature, you must calibrate the C9 Server for that halftone screen before you print a job with it.

Changing calibration has the potential to affect all jobs for all users, so consider limiting the number of people authorized to perform calibration. Set an Administrator password to control access to calibration (see Configuration and Setup).

Check calibration status

You can check when the C9 Server was last calibrated in Command WorkStation.

Check the calibration status for a job

- In Command WorkStation, in Job Center, select the job.
  The time of the most recent calibration is displayed in the lower-right corner.

Check the status of a specific calibration

1 In Command WorkStation, in Device Center, click the General tab, click Tools, and then click Manage (under Calibrate).
  The list of calibration settings on the C9 Server appears in Calibrator.

2 Find the calibration in the list and check the Last calibrated value.
  Default measurements indicates the factory settings, which means that the C9 Server has not been calibrated.
  You can configure Command WorkStation to optionally display a warning or suspend printing if the calibration of a job is out of date. For more information, see the online help.
Calibrator in Command WorkStation

You can calibrate the C9 Server with Calibrator in Command WorkStation. Calibrator provides a choice of measurement methods depending on the methods supported by your C9 Server:

- ES-1000 or ES-2000 - EFI ES-1000 or ES-2000 hand-held spectrophotometer
  
  For more information about this method, see the online help.

Multiple users can connect to one C9 Server with Command WorkStation, but only one user at a time can use Calibrator. If you try to calibrate when another user is using Command WorkStation to calibrate, an error message is displayed.

Before you save calibration measurements, you can check the calibration by printing a test page to see if it prints as you expect. It may also be helpful to print your own test page with the colors and job settings that are important to you.

Calibrator allows you to view the calibration measurements as a graph of input versus output curves for C, M, Y, and K.

- If the maximum measured density of a colorant is less than the target value, print a test page to check the output, especially areas with a lot of that particular colorant.

- If the maximum measured density is greater than or equal to the target value, this is usually not a problem.

If the curves are not smooth, it may be because the printer does not print uniformly across the page. The calibrated output may still be acceptable.

One way to check uniformity is to print a test job that covers the page with a single colorant (C, M, Y, or K) at the percentage that you want to check. Lack of uniformity is usually visible with values between 15% and 30%. This page must be printed without color management (CMYK Source set to Bypass Conversion). If lack of uniformity is visible, we recommend that you calibrate using one of the sorted patch layouts, which helps to minimize banding in gradients. However, calibration cannot fix the lack of uniformity of the printer.

Calibrate the C9 Server with Command WorkStation

1 Start Calibrator by doing one of the following:
   
   - In Command WorkStation, in Job Center, click the Calibrate icon.
   - In Command WorkStation, in Device Center, click the General tab, click Tools, and then click Calibrate.
   - In Command WorkStation, in Job Center, right-click a held job and select Calibrate job.
     
     In this case, Calibrator automatically selects the calibration setting used by the job.

2 Follow the procedure for your measurement instrument.
   
   For more information, see the online help.
Managing calibration settings

Every output profile on the C9 Server must be associated with a calibration setting. The calibration setting provides the C9 Server with density measurements of each of the printed colorants, for specific printing conditions (for example, media type). This data, along with the expected density response of the printer, allows the C9 Server to apply corrections to color values that are sent to the printer, to achieve the calibrated output.

An output profile can be associated with only one calibration setting, but the same calibration setting can be used by more than one output profile.

A calibration setting must be associated with at least one output profile, otherwise the calibration setting will never be used for printing.

Output profiles and calibration settings

The C9 Server has one or more factory-supplied output profiles. These output profiles and their associated calibration settings may produce acceptable color quality. However, you may need to create custom calibration settings and output profiles, depending on your situation.

<table>
<thead>
<tr>
<th>Your paper</th>
<th>Action</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1  Recommended paper for a factory-supplied output profile (the paper that the profile is based on)</td>
<td>Printing with the output profile produces acceptable color. You do not need to create a calibration setting or custom profile.</td>
<td>You can find the recommended paper for an output profile in Calibrator.</td>
</tr>
<tr>
<td>2  Paper similar to a factory-supplied profile’s recommended paper</td>
<td>You might be able to use the output profile. The print settings required for your paper (for example, media type and media weight) must match the print settings required by the recommended paper. If the color quality is acceptable, you do not need to create a calibration setting or custom profile.</td>
<td>The output profile name usually indicates the general type of paper (for example, plain, coated, or heavy). You can find the print settings required for the recommended paper in Calibrator.</td>
</tr>
<tr>
<td>3  Paper that is similar to a factory-supplied profile’s recommended paper, but uses different print settings</td>
<td>You might still be able to use a factory-supplied output profile, if you create a custom calibration setting and use it to calibrate the C9 Server with your paper.</td>
<td>You can create a custom calibration setting in Calibrator.</td>
</tr>
<tr>
<td>4  Paper that does not yield acceptable color with any factory-supplied profile</td>
<td>You must create a custom calibration setting and custom profile.</td>
<td>Use profile-generating software to create a custom profile.</td>
</tr>
</tbody>
</table>

Note: Recommended papers are chosen for color quality, as well as other factors, such as feeding reliability and quality of transfer.
**Find recommended paper and print settings**

You can find the recommended paper and print settings for a particular output profile in Calibrator. There is a recommended paper for each output profile and calibration.

1. In Command WorkStation, in Device Center, click the **Color Setup** tab and click **Color Management**.
2. Select the output profile and note the name of the calibration setting displayed to the right.
3. In Device Center, click the **General** tab, click **Tools**, and then click **Manage** under **Calibrate**.
   
The list of calibration settings on the C9 Server appears in Calibrator.
4. Select the calibration setting from the list.
   
The recommended paper is shown in the list and the required print settings are displayed in the calibration-related properties.
5. Click **Close** to close the window.

**Custom calibration settings**

If you are printing on a paper that is similar to the recommended paper, but uses different print settings, you might still be able to use the output profile, but you must create a custom calibration setting. If the color quality is acceptable, you do not need to create a custom profile.

You can add a new calibration setting that you can then select when performing calibration. You can delete a custom calibration setting. You cannot delete a factory-supplied calibration setting.

For information about adding a custom calibration setting, see the online help.

**Custom calibration settings and output profiles**

If you determine that none of the factory-supplied output profiles produces acceptable color with your paper, you must create a custom calibration setting in Calibrator and a custom profile using profile-generating software.

To create a custom calibration setting, you print a page of color patches on the C9 Server using your paper and measure the page with Calibrator.

**Note:** Before creating a custom calibration setting and custom output profile, make sure that the printer is calibrated (if calibration is supported on the printer). For information about performing printer calibration, see the documentation that accompanies the printer.

When color quality is important, make sure that the C9 Server is calibrated for the particular halftone screen that you use. Changing a halftone screen usually modifies the color response of the printer. For more information, see *Fiery Graphic Arts Package, Premium Edition*. 

---

*Color Printing Calibration* 32
Understanding calibration

Calibration generates adjustments to toner densities that account for the difference between the actual toner densities (measurements) and the expected response (target).

- Measurements represent the actual color behavior of the printer.
- Calibration settings contain sets of measurements that represent the output for specific printing conditions, such as media and print options.
- Each calibration setting is associated with a calibration target that describes the expected behavior of the printer.

After you calibrate the C9 Server for a specific calibration setting, the measurements are stored. These measurements are used to adjust output densities when you print with the output profile associated with the calibration setting.

Although the needs of most users are met by the default calibration setting, the C9 Server allows you to select a calibration setting to customize calibration for specialized jobs.

Every output profile has an associated calibration setting. If you have not specified one, the calibration setting associated with the default output profile is used.

How calibration works

Success in obtaining satisfactory print quality from the C9 Server depends on many factors. Among the most important are establishing and maintaining optimal toner densities. The density is the measure of the light absorbed by a surface. By carefully regulating toner densities, you obtain consistent printed color.

Calibration allows you to:

- Maximize the color reproduction capabilities of the C9 Server.
- Ensure consistent color quality over time.
- Produce consistent output across more than one C9 Server.
- Achieve better color matches when reproducing spot colors, such as PANTONE colors or other named color systems.
- Optimize the C9 Server for using ColorWise rendering intents, CMYK simulations, and ICC profiles.

Even with a calibrated system, toner density is affected by the settings of the printer, humidity, and temperature. Density also tends to drift over time. Uneven toner density on paper affects calibration results. Regular measurement detects day-to-day variations in density, gradation, and color reproduction, and calibration corrects them.

Calibration works by calculating adjustments that compensate for the difference between actual (measured) and desired (target) density values. These calibration adjustments are often depicted as mathematical curves for each of the colorants.

When to calibrate

Calibrate the C9 Server at least once a day, depending on the volume of print jobs. If it is very important to maintain consistent color, or your printer is subject to wide fluctuations in temperature or humidity, calibrate every few hours. For optimal performance, calibrate whenever there is a noticeable change in print quality or printing results are not as expected.
If you must split a print job into two or more batches to print at different times, it is important to calibrate before you print each batch. You should also calibrate the C9 Server after printer maintenance. However, because the printer may be less stable immediately after maintenance, wait until you have printed approximately 50 pages before you calibrate.

**Note:** Because output from the printer is very sensitive to changes in temperature and humidity, do not install the printer near a window, in direct sunlight, or near a heater or air conditioner. Paper is also sensitive to climate changes. Store it in a cool, dry, stable environment, and keep reams sealed until they are used.

To monitor print quality, print a color reference page. A good reference page includes fully saturated color patches and pale tints of cyan, magenta, yellow, and black. Images with skin tones offer a good basis for comparison. Save and periodically compare the pages you print. If a noticeable change in appearance occurs, calibrate the C9 Server.

When you examine the reference page, all color patches should be visible, even though they may be very faint in the five to two percent range. Each patch set should show uniform gradation from patch to patch as the color lightens from 100% to zero.

If the solid density patches (100% cyan, magenta, yellow, or black) look less saturated over time, show the pages to your service technician to determine whether adjusting the printer can improve output.
Spot-On

The Spot Color Matching print option automatically matches spot colors with their best CMYK equivalents so that spot colors can be simulated using the CMYK colors. However, you may want to adjust the default CMYK equivalents to achieve a better match for your specific printing conditions. You can modify spot colors with the Spot-On spot color editor in Command WorkStation.

**Note:** Spot colors are also called “named” colors because a color name is used to represent a specific CMYK value.

Spot Colors in Command WorkStation

The Spot Colors feature is a spot color (named color) manager in Command WorkStation that allows you to edit spot color definitions on the C9 Server and create custom spot color definitions. Spot Colors is a part of the Spot-On feature. If Spot-On is available for your C9 Server and is activated on the C9 Server, you can adjust and manage lists of spot colors and their CMYK equivalents.

The Spot-On feature is in Command WorkStation, in Device Center, in the Spot Colors window under the Resources tab.

Spot Colors comes pre-loaded with libraries of named colors such as those from PANTONE, HKS, TOYO, and DIC. The spot color libraries store the original colors with their device-independent definitions (Lab values). For each output profile on the C9 Server, Spot Colors computes the best available CMYK reproduction of each spot color. Each time a new profile is generated or updated, Spot Colors automatically recalculates the best CMYK equivalents.

You can create a list of “substitute” colors. These are colors that, when called for in a document by their RGB or CMYK values, are substituted with a different color having the CMYK values from the Spot Colors color definition. This permits exact color control and overrides individual RGB and CMYK colors.

If 2-Color Print Mapping is available for your C9 Server, and is enabled, Spot Colors also allows you to assign spot colors and process colors to the generic colors that are used in a job. The 2-Color Print Mapping feature is designed for print shop operators to simulate a two-color press. You can print a two-color job to a two-color device by mapping the colors in a job to the colors that are already created on the device.

For more information about 2-Color Print Mapping, see *Fiery Graphic Arts Package, Premium Edition*.

For more information about Spot Colors and Substitute Colors, see *Command WorkStation Help*.

How Spot-On works

Spot-On allows you to adjust and manage lists of spot colors and their CMYK equivalents. The matching lists of spot colors and CMYK values are known as spot color dictionaries. Spot-On allows you to maintain multiple spot color dictionaries for each output profile on the C9 Server.

In Spot-On, you specify the job properties that you use to print a job. Based on the settings, Spot-On determines the output profile and its associated spot color dictionary.
If you select Output profile X and redefine PANTONE 123 from 30%M to 50%M using Spot-On, the output will reflect 50%M when you print a job with Output profile X. If you print a job with Output profile Y, you will get the original value.

If you select Output profile X and create a custom color named "My Purple" and define it as 80%C 40%M, the C9 Server automatically calculates the Lab values using Output profile X and creates new CMYK values for use with Output profile Y.

To use the Spot-On features with named colors, you must enable the Spot Color Matching print option.

**Note:** Spot colors that are identified by name are printed with their defined CMYK values. Edits to an output profile made in Command WorkStation do not affect how spot colors are printed.

Any edits made to a job with the color adjustment features in ImageViewer affect all of the colors in the job, including spot colors.

### Monitor settings

This feature requires that a job be displayed with correct colors on your monitor. To display the colors correctly on your monitor, you must set up the monitor according to the manufacturer’s recommendations, and specify the correct monitor profile for your monitor.

Specify the following settings for the monitor:

- On the monitor: Brightness, Contrast, and Color Temperature
- In the operating system: Resolution, Refresh rate, and Number of colors

For more information about setting up the monitor and the monitor profile, see the documentation that accompanies the monitor.
Specialty colors

A specialty color is an additional color (besides Cyan, Magenta, Yellow, and Black) installed on the printer. Specialty color features on the C9 Server give you access to specialty colors.

Either White toner or Clear toner can be installed on the printer. The C9 Server treats White or Clear toner as a specialty color.

- White - For printing on transparent media, you can print White toner on top of other colors so that it becomes a white background when the sheet is viewed from the non-printed side. You can also print white objects on colored paper or over an area of printed color.

- Clear - You can add a translucent layer of Clear toner over an entire page, similar to lamination, or overprint specific objects with Clear toner for a subtle highlighting effect.

The specialty color is printed last, after any CMYK colors.

**Note:** A specialty color cannot be used as a process color. A specialty color is used only as a spot color or color layer.
This example shows white or clear toner printing over a CMYK red image.

1 White or clear toner
2 CMYK color
3 Printed output

With specialty colors, the C9 Server can print specialty color in areas of a page designated as a special spot color. You can create documents with spot colors in a design application that supports spot colors, such as Adobe InDesign or Quark XPress. Microsoft Office applications do not support spot colors.

If you cannot create spot colors in your job, you can still apply a specialty color to the job in the following ways:

- The C9 Server can print a specialty color, including Clear toner, over an entire page.
- When Clear toner is a specialty color, the C9 Server can overprint objects of a specified type (text, graphics, or images) with Clear toner.
Configure a specialty color in Command WorkStation

To be printed with a specialty color, a document must contain a special spot color. The spot color name must exactly match the name of the spot color configured for the specialty color on the C9 Server. The name is case-sensitive.

- If the specialty color feature has been activated on the C9 Server, the C9 Server has a specialty color group that contains a default spot color. This spot color represents the specialty color. Any spot color that you add to the specialty color group can also represent the specialty color.
  
  The Clear color group contains the default spot color named Clear. The White color group contains the default spot color named White.
  
- If a document already contains a spot color with the specialty color name defined on the C9 Server, the document can be printed with the specialty color.
  
- If a name other than the specialty color name is used in the document, you must create a spot color of the same name on the C9 Server, using Specialty Colors in Command WorkStation.

Note: Specialty Colors uses the same spot color editing features as Spot-On. You cannot edit spot colors and specialty colors at the same time.

If you do not know the spot color name that is used in a job, you can submit the job to the Hold queue of the C9 Server and use the Preflight feature of Command WorkStation to analyze the job and display the names of the spot colors used in the job. Preflight is a feature of Fiery Graphic Arts Package, Premium Edition.

1. In Command WorkStation, go to Device Center, click the Resources tab, and click Specialty Colors.
2. Select the specialty color group and click New.
3. Type the specialty color name exactly as it is used in your document and click OK.
   A specialty color name, for example WHITE_INK or CLEAR_INK, that was defined on the printer or another server can be used.

   Note: Double-byte characters are not supported.

Print a job with Clear toner

You can print a job with Clear toner that you have specified as a spot color in Adobe InDesign, QuarkXPress, or other design application. On the C9 Server, Clear toner is treated as a specialty color.

A specialty color must be present on the C9 Server to represent the Clear spot color in your document. For more information, see Configure a specialty color in Command WorkStation on page 39.

Clear toner must be installed on the printer.

Note: If you change the specialty color that is installed on the printer to a different specialty color, you must restart the C9 Server before you can print with the new specialty color.

If you print the job from an application using the printer driver, Two-Way Communication must be enabled in the printer driver, which allows the printer driver to detect that Clear toner is installed on the printer.

Before you can print from an application using Clear toner, you must turn on the Clear installable option for the specialty color in the printer driver.
A specialty color group called Clear is configured on the C9 Server. The Clear color group contains a specialty color called Clear.

1. In your application, create a new spot color to represent the Clear toner color, if one does not already exist. If you want to be able to print a test print with an alternate color instead of Clear toner, be sure to specify an alternate color for the spot color.

2. Using the new spot color, specify the objects in the document to be overprinted with Clear toner.

   To overprint an object with Clear toner, create an object of Clear spot color on top of the object and set the Clear object to overprint. If the Clear object is not set to overprint, it knocks out the background object.

3. In your application, click File > Print, select the C9 Server as your printer, and then go to the Fiery print options in the printer properties.

   Alternatively, submit the job to the Hold queue of the C9 Server, and then set print options in Job Properties in Command WorkStation.

4. On the Color tab, check that Composite Overprint is selected.

5. On the Specialty Color tab, select how to apply Clear toner in specific areas or types of objects.

   • Do not print Clear - Spot colors in the Clear specialty color group are ignored and Clear toner is not applied. The first time that you print a job, you might want to select this setting to print a test print without Clear toner. After you check the output and resolve any problems, you can reprint the job with Clear toner. This practice helps to conserve the Clear toner supply.

   • Apply Clear to ‘Clear’ spot color(s) and selected - Spot colors in the Clear specialty color group are printed with Clear toner and any objects of a selected type are overprinted with Clear toner.

      You can select Clear toner overprinting for Text, Graphics, Images, and/or any spot color areas, even if there are no Clear spot colors in the job.

   • Apply Clear to full page - A layer of Clear toner is applied to the full page regardless of any spot colors defined in the job.

   • Use alternate color for ‘Clear’ spot color(s) if present - Substitutes any color in the Clear specialty color group with the alternate spot color defined in the document. Clear toner is not applied.

      Use this setting to print a test print and check the placement of Clear toner in the output before you actually print with Clear toner.

   • Apply Clear specialty color to all areas printed with CMYK - Any area printed with any amount of CMYK is overprinted with Clear toner.

   • Replace CMYK with Clear - Any area printed with any amount of CMYK is replaced with Clear toner. No CMYK is printed.

6. Select the pages or sheets to apply the specialty color settings to.

   Specialty color is not applied to any pages or sheets that are excluded from the selection.

7. Print the job.
Print a job with White toner

You can print a job with a white spot color that you have specified in Adobe InDesign, QuarkXPress, or other design applications.

A specialty color must be present on the C9 Server to represent the White spot color in your document. For more information, see Configure a specialty color in Command WorkStation on page 39.

White toner must be installed on the printer.

**Note:** If you change the specialty color that is installed on the printer to a different specialty color, you must restart the C9 Server before you can print with the new specialty color.

If you print the job from an application using the printer driver, Two-Way Communication must be enabled in the printer driver, which allows the printer driver to detect that White toner is installed on the printer.

Before you can print from an application using a specialty color, you must turn on the installable option for the specialty color in the printer driver.

A specialty color group called White is configured on the C9 Server. The White color group contains a specialty color called White.

1. In your application, create a new spot color to represent the White specialty color, if one does not already exist.
   
   If you want to be able to print a test print with an alternate color instead of the specialty color, be sure to specify an alternate color for the spot color.

2. Using the new spot color, specify the objects in the document to be printed with the specialty color.
   
   The job does not need to have any overprinting with spot colors defined and can be created with an application that does not support an overprinting function.

3. In your application, click File > Print, select the C9 Server as your printer, and then go to the Fiery print options in the printer properties.

   Alternatively, submit the job to the Hold queue of the C9 Server, and then set print options in Job Properties in Command WorkStation.

4. On the Color tab, check that Color Mode is set to CMYK and that Composite Overprint is selected.

   These print settings are required for specialty color.

5. On the Specialty Color tab, select how to apply White toner in specific areas.

   - **Do not print White** - Spot colors in the White color group are ignored and White toner is not applied.
     
     The first time that you print a job, you might want to select this setting to print a test print without White toner. After you check the output and resolve any problems, you can reprint the job with White toner. This practice helps to conserve the White toner supply.

   - **Apply White to 'White' spot color(s) and selected** - Spot colors in the White color group are printed with White toner and any objects of a selected type are overprinted with White toner.
     
     You can select White toner overprinting for Text, Graphics, Images, and/or any spot color areas, even if there are no White spot colors in the job.

   - **Apply White to full page** - A layer of White toner is applied to the full page regardless of any spot colors defined in the job.
• Use alternate color for 'White' spot color(s) if present - Substitutes the White spot color with the alternate color defined in the document. White toner is not applied.

  Use this setting to print a test print and check the placement of the White toner in the output before you actually print with the White toner.

• Apply White specialty color to all areas printed with CMYK - White toner is applied to any area printed with any amount of CMYK.

• Replace CMYK with White - Any area printed with any amount of CMYK is replaced with White toner. No CMYK is printed.

6  (C941/Pro9541/ES9541 only) Select whether White toner is printed first (under any CMYK areas) or last (over any CMYK areas).

  For all other printer models, White toner is always printed first.

7  Select the pages or sheets to apply the specialty color settings to.

  Specialty color is not applied to any pages or sheets that are excluded from the selection.

8  Print the job.
Image Enhance Visual Editor

Image Enhance Visual Editor (IEVE) is an image editing application that provides users with a visual workspace to adjust individual images in a job. With IEVE, you can see the effects of your adjustments and fine-tune the appearance of an image.

With IEVE, you can adjust tone, color, and sharpness, and perform red-eye correction. You can apply the same adjustments to all images on a page or a range of pages. When you save a set of adjustments as a preset, you can easily apply the same adjustments in the future.

Adjustments made in IEVE affect the job on the server and cannot be applied to the original source document. IEVE is accessible from Command WorkStation. For more information about IEVE, see the online help.

Access IEVE in Command WorkStation

1 In Job Center in Command WorkStation, select the job containing the images that you want to adjust.
   
   Note: IEVE supports PDF, PostScript, and imposed (.dbp) jobs only.

2 To start IEVE, do one of the following:
   • Select Actions > Image Enhance Visual Editor.
   • Right-click the selected job and select Image Enhance Visual Editor from the menu that appears.

IEVE and Apply image enhancement print option

IEVE adjustments are independent of the configurable Apply image enhancement print option. If the Apply image enhancement print option is turned on for a job that is also modified with IEVE, the effects of both are applied to the images in the job. We recommend that you use one or the other, not both, for a job.

• The Apply image enhancement print option is a faster way to apply simple adjustments that do not require visual confirmation before printing.

• IEVE is faster for making selective adjustments that require fine-tuning and visual inspection.
